**FX**<sup>3</sup> **decoders** have motor isolation protection. If the decoder senses that the motor is not isolated, it will not run the motor. In this case, you will be able to control the loco's functions but the motor will not work.

#### CVs used for this decoder

| CV#                    | Feature                     | Default | Range     | Notes              |
|------------------------|-----------------------------|---------|-----------|--------------------|
| Locomotive Address CVs |                             |         |           |                    |
| 01                     | 2 Digit Decoder Address     | 03      | 001-127   |                    |
| 17                     | 4 Digit Address (High Byte) | 00      | 0128-9983 | CV17 & 18 are used |

| 18        | 4 Digit Address (Low Byte)        | 00                           | 0128-9983         | Together to program the 4 digit address. Current production Digitrax throttles handle this automatically. See calculator below if separate values are needed by your system for programming 4 digit address |

#### Notes:

For CV155=01 semiautomatic notching, the Prime mover lowest Notch setting is set by the throttle speed setting. F6 (ON) can increase the Notch and F7 (ON) will decrease the Prime mover to the minimum notch set by current throttle setting.
